The following table shows the results of the regression analysis for the period 2000 to 2004. The dependent variable is the natural logarithm of the number of employees in the manufacturing sector. The independent variables are the natural logarithm of the number of employees in the service sector, the natural logarithm of the number of employees in the construction sector, the natural logarithm of the number of employees in the agriculture sector, and the natural logarithm of the number of employees in the manufacturing sector. The results show that the number of employees in the manufacturing sector is positively correlated with the number of employees in the service sector, the natural logarithm of the number of employees in the construction sector, and the natural logarithm of the number of employees in the agriculture sector. The coefficient for the natural logarithm of the number of employees in the manufacturing sector is 0.10, which is statistically significant at the 1% level.
